#### Abstract

The Mincer earnings function is the cornerstone of a large literature in empirical economics. This paper discusses the theoretical foundations of the Mincer model and examines the empirical support for it using data from National Labour Survey 2019. Inferences about trends in rates of return to formal education and vocational training obtained from our more general model differ substantially from inferences drawn from estimates based on a Mincer earnings regression. In this scenario to estimate econometrics model the multiple regression model was applied with the support Stata data analyzing software according statistical results shows that Formal education and Vocational training are high significance to determine the Income. Descriptive statistics was done to study the characteristics of sample population. As per the descriptive statistics the mean value of log hourly income was LKR 6.21. The average years of education, average years of labour market experience and vocational training were $10.09,2.45$ and 2.61 respectively. The regression analysis revealed that there is a positive relationship between income and formal education and vocational training.

Keywords: Return, Formal education, Vocational training

## INTRODUCTION

Sri Lanka's workforce is better educated than that of other countries in the South Asia region. However, the high education outcomes are not translated into competitiveness of the economy. According to the 2013 Global Competitiveness Index, Sri Lanka is now transitioning from the factor-driven to the efficiency-driven stage of development.

Higher value-added production, increased productivity, technology usage, and efficient work organization are key factors affecting competitiveness and crucial in supporting the move beyond current production processes. Increasing the competitiveness of the economy requires an efficient technical and vocational education and training (TVET) sector to support skills formation linked with movement up the value chain.

The concept of human capital recognizes that not all labour is equal. But employers can improve the quality of that capital by investing in employees the education, experience, and abilities of employees all have economic value for employers and for the economy as a whole. Earnings functions are the most widely used empirical equations in labour economics and the economics of education. In Mincer's original model, the variation in individuals' wages is explained by variations in years spent in education and years of labour market experience, with a linear relationship between schooling and wages. Therefor the study has done according to the Mincer's Human Capital Theory.

## LITERATURE REVIEW

## Human Capital Theory

Based on the Human Capital Theory this study has done. Human Capital Theory can be classified as the economic value of a worker's experience and skills. This includes assets like education, training, intelligence, skills, health, and other things employers value such as loyalty and punctuality (Becker, 2008).

## Mincer's model

Mincer's model is explained the linear relationship between the education and wages. Where the wages are explained by the variations in number of years spent in formal education, vocational training and number of years of experience in labour market.

```
\(\ln Y_{t}=\beta_{0}+\beta_{1} X+\beta_{2} Z+\beta_{3} Z^{2}+\mu\)
Yt - Hourly wage at time \(t\)
\(\beta 0\) - Initial earning capacity
\(\beta 1\) - Rate of Returns to Education
\(\beta 2, \beta 3\) - Rate of Returns to experience
X - Years of
Education Z - Years
of Experience
\(\mu\) - Random error term
```

(Mincer,1974)

## RETURNS OF FORMAL EDUCATION AND VOCATIONAL TRAINING

Lonescu and Cuza (2012) state that, education is frequently seen as a crucial policy instrument on the fight against poverty as it may help individuals to access better jobs that raise their labour earnings and thus contribute to the improvement of their lives. On the labour market, education provides both productive capacities to individuals and their signals to potential employs hence attained qualifications are a main asset in worker competition for jobs available on the labour market (Gangl, 2000). Educational systems still remain the fundamental employment determinants. Colclough, Kingdon \& Patrinos (2010) claimed that the returns to primary education are decreasing whereas returns to secondary and tertiary education are increasing. Therefore, the study is analyzed the returns to formal education and vocational training.

## SCOPE OF THE STUDY

## Main Objective

$>$ To identify impact of formal education and vocational training on returns to education.

## Specific Objectives

$>$ To find out relationship between Income and Formal education.
$>$ To identify relationship between Income and Vocational training.

## METHODOLOGY OF THE STUDY

Multiple Linear Regression
$\ln \mathrm{Yt}=\beta 0+\beta 1 \mathrm{~A}+\beta 2 \mathrm{~B}+\beta 3 \mathrm{~B}^{2}+\beta 4 \mathrm{CD}+\mu$
Where,

Yt :Income per hour at the time $t$
$\beta 0$ :Initial capacity of earning
$\beta 1$ :Rate of Returns of Education Years
$\beta 2$ :Rate of Returns to Experience
$\beta 3$ :Rate of Returns to Experience
$\beta 4$ :Rate of Returns of Vocational Training
A :Years of Education at time $t$
B :Years of Experience at the time $t$
C :Vocational Training at time $t$
D :Years of Vocational Training at time $t$
$\mu$ :Error Term

Log value of Income per hour is dependent variable and Years of Schooling, Years of Experience, Square of Years of Experience, Vocational Training and Years of Vocational Training are independent variables.

Econometric issues associated with the model, such as heteroscedasticity and multicolinearity, Further Breusch-Pagan test, correlation matrix, Variance Inflation Factor and Shapiro-Wilk test were performed to detect them. To correct the detected econometric issues encountered within the model, White Correction and Principal Component Analysis were performed.

## RESULTS AND DISCUSSIONS

## Descriptive Statistics

Summarize Log Incomephour edu Experience ExprncSquare VOCTraining

| Variable | Obs | Mean | Std. Dev. | Min. | Max |
| :---: | :---: | :---: | :---: | :---: | :---: |
| log income | 3000 | 6.217894 | .5865296 | 4.199705 | 9.21034 |
| Edu | 3000 | 10.09433 | 3.514952 | 0 | 17 |
| Experience | 3000 | 2.4536 | 1.410746 | 0 | 7.1 |
| ExprncSquare | 3000 | 8.009693 | 8.00328 | 0 | 50.41 |
| VOCTraining0 | 3000 | 2.609333 | 8.08813 | 0 | 84 |

Table 1 : Summary Statistics of variables
Source: national labour Survey data 2019
.correlate edu Experience ExprncSquare VOCTraining
(Obs=3000)

| Variables | edu | Experi $\sim \mathbf{e}$ | Exprnc $\sim \mathbf{e}$ | V0CTra~g |
| :---: | :---: | :---: | :---: | :---: |
| edu | 1000 | - | - | - |
| Experience | -0.5194 | 1.0000 | - | - |
| ExprncSquare | -0.5497 | 0.9614 | 1.0000 | - |
| VOCTraining | 0.2577 | -0.1334 | -0.1346 | 1.0000 |

Table 2: Correlation between independent variables

Based on this analysis table 1 result shows that total observations are 3000 and Minimum income is 4.2 as well as 9.2 is maximum income. Mean of income is 6.21. Maximum experience is 74 and Minimum experience is zero.
Table 2 results shows that negative correlated between Experience and Education which is 0.5194 and Negative correlation between Experience square and Education. It has econometrics issues (Multi-collinearity) which mean that Expr2 and Experience correlated value is high 96 percentage positive correlated therefore it has multi-collinearity issues.

## RESULTS OF THE STUDY

| regress log_Incomephour edu Experience ExprncSquare VOCTraining |  |  |  |  |  |  |  |

Table 3: Multiple linear regression analysis
Mincer equation for the model is,

$$
\ln \mathrm{Yt}=\beta 0+\beta 1 \mathrm{~A}+\beta 2 \mathrm{~B}+\beta 3 \mathrm{~B}^{2}+\beta 4 \mathrm{CD}+\mu
$$

According to Multiple linear regression analysis of the model,

$$
\begin{aligned}
& \beta 0=4.93 \\
& \beta 1=0.087 \\
& \beta 2=0.27 \\
& \beta 3=-0.36 \\
& \beta 4=0.01
\end{aligned}
$$

Mincer equation rewritten for the Model as,

$$
\ln \mathrm{Yt}=4.93+0.087 \mathrm{~A}+027 \mathrm{~B}-0.36 \mathrm{~B}^{2}+0.01 \mathrm{CD}+\mu
$$

This model explain that P - Value of all independent variable are less than 0.05 p - value which means that all these variables are significant to determine the Income. If other variable is constant income will increase by 4.93 units. Negative relationship between Income and Expr2 which is -0.36 coefficient value this means that one unit increase Expr2 Income will increase by -. 36 units.

Table 8: Multiple regression analysis
This results indicate that P - Value which is less than 0.05 therefore all these variables explain above jointly significance as well as this model shows that value of R Squared and Adjusted R Squared is 0.28 this means that 28 percentage of variation in Income could be jointly explain by these independent variables but 72 percentage of variation in Income could be explain by other variables this means that all independent variables are cumulatively determine 28 percentage of Income.
Number of observation: 3000. This is the number of observation used in regression analysis. F (3, 2996): 375.88: F stat for overall significance. It is a joint test of all the slope coefficient. If Pro. $>$ F: is less than 0.05 there is model fit is statistically significance. Therefore this model fit statistically significance so that. Null hypothesis Rejected $\left(\mathrm{H}_{0}\right)$ so Alternative Hypothesis Accept. Which mean that there is an impact of formal education and vocational training on returns to education.
R square \& Adjusted R square: Coefficient of determination and its adjusted value. These explain in proportion of total variation of Income explained by the regression. Adj. R ${ }^{2}$, Adj. $\mathrm{R}^{2}=0.28$ means that $28 \%$ of variation of Income is explained by the regression. Root MSE: Square Root of Mean Standard Error of the regression.

| VOCTraining | . 0104977 | . 0011444 | 9.17 | 0.000 | . 0082539 |  | . 0127415 |
| _cons | 4.932823 | . 0456208 | 108.13 | 0.000 | 4.843372 |  | 5.022274 |

Table 9: White correction for Heteroscedasticity

As Heteroscedasticity presents, the null hypothesis is rejected as the chi2 value is greater than $p$ value.

Value of 'experience' and 'experience square' is near to $1.0000(0.9614)$. Therefore, there is a heteroscedasticity.

## TEST TO IDENTIFY MULTICOLINEARITY

. pwcorr log_Incomephour edu Experience ExprncSquare

| Variable | VIF | 1/VIF |
| :--- | :---: | :---: |
| ExprncSquare | 13.87 | 0.072105 |
| Experience | 13.25 | 0.075461 |
| EDU | 1.51 | 0.662121 |
| VOCTraining | 1.07 | 0.932952 |
| Mean VIF | 7.43 |  |

Mean VIF (7.43) is greater than 5 , therefore there is a multicollinearity.
VIF of 'experience' and 'experience square' is greater than 10 . It means there is concrete multi/collinearity between 'experience' and 'experience square'.
To overcome econometric problems, correct the model wherever necessary.
Heteroscedasticity Correction

Using the Principal Components Analysis can be correct multi-colinearity issue.

## ANALYSIS

The multiple regression analysis revealed that there is a positive relationship between returns to education and labour market experience in Sri Lanka. The null hypothesis can be rejected, as the $z$ value for the test is greater than that of $p$-value. There is an impact of formal education and vocational training on returns to education. And log value of returns is positively related with the formal education and vocational training.
Rejection of null hypothesis in the Breusch - Pagan test revealed that heteroskadesticity was there in the model. Multic-ollinearity within the model we identified through correlation matrix and variation influence factor tests. According to them corrections were made in the model.

## SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

The Mincer earnings function is the cornerstone of a large literature in empirical economics. Accordingly, a multiple regression analysis was performed to explore the relationship between returns to education and vocational training. The analysis revealed that there is a positive impact on income to the returns to education and vocational training. As there are several influencing factor in the returns to formal education and vocational training, Mincer's original

Universe International Journal of Interdisciplinary Research (Peer Reviewed Refereed Journal)

earnings function doesn't give clear idea as those factors were not considered in the model.
